

## 9500+ Trigger/Gate Option

The Trigger/Gate option adds a second non-adjustable external input to the rear panel of the 9500+ family of pulse generators. The added input is an opto-isolated signal that can be used as a gate or trigger for either the system or the channels. The second input threshold voltage is approximately 15V. Either input may be specified as the channel gate input. The other input will then be assigned as the system trigger/gate input. All other 9500+ pulse generator functionality stays the same.

### Specifications:

New Input	Opto-isolated
Voltage	Up to 25V
Current	4mA
